09 Building and disseminating a controlled and free vocabulary for archaeology, between open access policy, compliance with standards and multilingualism: the example of the Pactols thesaurus.

Blandine Nouvel (blandine.nouvel@univ-amu.fr)

The Pactols thesaurus, developed by the Fédération et ressources sur l'Antiquité (Frantiq, a thematic network of the CNRS-SHS) over more than 40 years, is an original example of a standardised and open documentary tool which, since its reorganisation in 2020, has found its place within the French archaeological community and beyond. This presentation will explain how strategic choices have led to the evolution of a documentary thesaurus initially limited to the world of libraries into a reference tool that facilitates interoperability and consolidation of archaeological research data. Compliance with standards and the support of open technologies constitute the technical foundation necessary for its proper management and dissemination. It supports a unique, and multilingual lexical set of 13,000 subject keywords and 50,000 place terms, dedicated to archaeology from Prehistory to the contemporary period and to all aspects of the classical studies. It is developed and updated by information experts with the validation of specialists in the discipline. Its organisation is adapted from an ontological model and its alignment with other web repositories makes it a resolutely modern tool, adapted to the challenges of data FAIRisation.
